Have assembled a team of experts to help operationalize the White House "Opening America" framework

Executive Summary: The War on COVID-19

- Global cases & deaths continue to rise. Mitigation efforts have led to some level of "flattening", but with severe economic consequences
 - The US new daily cases are beginning to decline, but still account for 1/3 of global daily new cases
 - MA new daily cases still high, but are seeing frequent periods of declining. Hospital ICU beds only ~50% filled
 - JP Morgan estimating Q2 GDP down ~40% QoQ. MA unemployment ~2x the GFC, with low income workers particularly hard hit
- Determining when to re-open is dependent on modeling out "supply and demand"
 - Key supply considerations include availability of beds and healthcare workers (taking into account burden of other illness/need) and therapeutic availability and effectiveness
 - Key demand considerations include a manageable current new case trajectory ("flattened curve"), confidence in ability to track case counts, and anticipated effectiveness of segmentation & worker safeguards
- If reopening causes a demand imbalance, risk a rolling lockdown scenario
 - 1918 Spanish Flu data warns of opening too early or with too little preparation could result in a second, larger spike in cases than the first
 - Spain re-opened once COVID-19 cases reached 20% of their prior peak, but was still too soon cases rapidly rose and Spain was forced to shut again
- Critical to design a "back-to-work" plan that does not overload hospitals and keeps people safe

We can defeat COVID-19 by implementing: (1) strategic population segmentation, (2) effective therapeutic treatments and longer term a vaccine, (3) full adoption of R_T reduction protocols

Contents

- Summary COVID-19 History & Economic Impact
- Timing: When to Return to Work
- The Key Three Steps: *How* to Return to Work

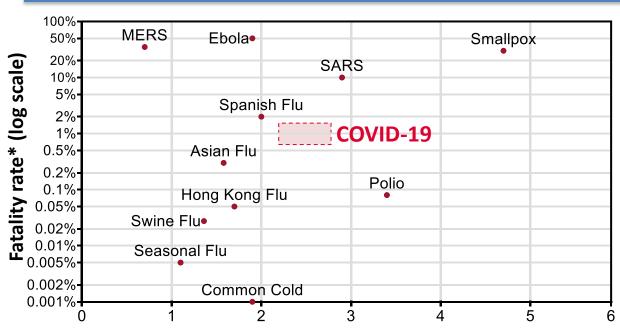

Global COVID-19 Cases Update

Global cases and deaths continue to rise. The US may be in early stages of "flattening" & Europe cases declining, but the rest of the world is still experiencing growth

Why is COVID-19 so serious?

Fatality Rate v. R₀

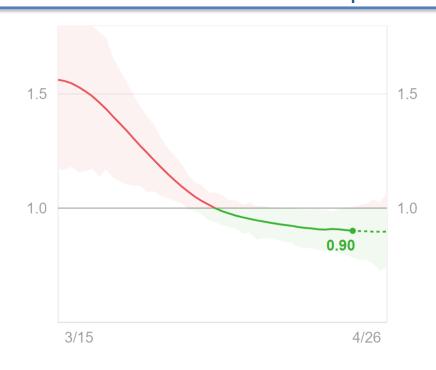

R₀ (average # of ppl infected by each sick person)

- Fundamental issue: COVID-19 has a high fatality
 rate and a high R₀ (high rate of infection)
- Additionally, COVID-19 has a high rate of hospitalization (~10%+), which combined with high rate of spread creates large tax on hospital capacity
- Finally, COVID-19 is **indiscriminate**, causing serious long term health consequences in all ages
- In order to return to work, need to adopt policies & procedures to reduce R_T

COVID-19 has a high spread & high rate of hospitalization / death – to return to work, need to adopt policies & procedures to reduce spread (R_T)

Massachusetts Estimated R_T Overtime

- Social distancing & mitigation efforts have successfully brought R_T down below 1, controlling the outbreak
- However, these efforts are having a significant impact on the economy
- Goal of a "back-to-work" program to put policies & procedures in place to keep R_T below 1 without as significant an impact on the economy

Today, MA's R_T has fallen below 1.0 – the virus is being contained. However, mitigation efforts are having a dramatic impact on the economy and thus are unsustainable

Economic Impact of Shutdowns

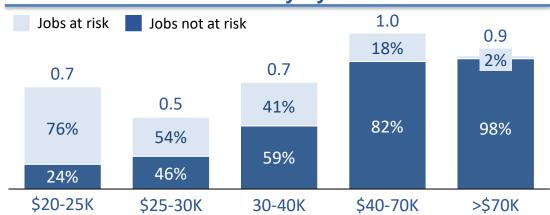

JP Morgan projecting US GDP to be <u>down 40%</u> QoQ in Q2; EU GDP to be <u>down 45-55%</u> QoQ

| | Real GDP | | | Real GDP % over previous period, saar | | | | | | |

MA Unemployment approaching 2x+ '09 levels

MA Job Vulnerability by Income Band

Mitigation efforts are having a significant impact on the economy, and impact is most severe in low income workers

COVID-19 History & Economic Impact: Summary

- Global cases and deaths continue to rise, but the US & Europe may be in the early stage of "flattening"
- COVID-19 is particularly serious because of its **high hospitalization & death rate** and **high rate of spread (R₀).** Unmitigated spread can quickly overwhelm hospitals
- While mitigation efforts are contributing to the early curve "flattening," they will have a dramatic economic impact in the U.S., with some analysts forecasting Q2 GDP declines 2-3x that of the great depression
- Workers earning less than \$40K/year and employed by small businesses are most vulnerable

Mitigation efforts are aiding in the fight against the virus, but are also having a significant impact on the economy, and impact is most severe in low income workers

Source: Bain Capital Partners Analysis

Contents

- Summary COVID-19 History & Economic Impact
- Timing: When to Return to Work
- The Key Three Steps: *How* to Return to Work

Determining When to Reopen

Supply

- Availability of supply inputs: beds, HC workers
- Timeline & supply of therapeutic options
- System readiness for policies to reduce R_T (e.g., testing, tracing, PPE capacity)

Demand

- Current new case trajectory manageable / "curve flattening"
- Confidence in ability to track cases
- Model projecting anticipated hospital burden based on # ppl returning to work & projected spread

Case Studies

China Return to Work

- Waited until new cases practically eradicated.
 Since then, new cases returned, but at much lower rates
- Firm workplace rules, rigorous testing, travel restrictions
- Comprehensive smartphone tracking

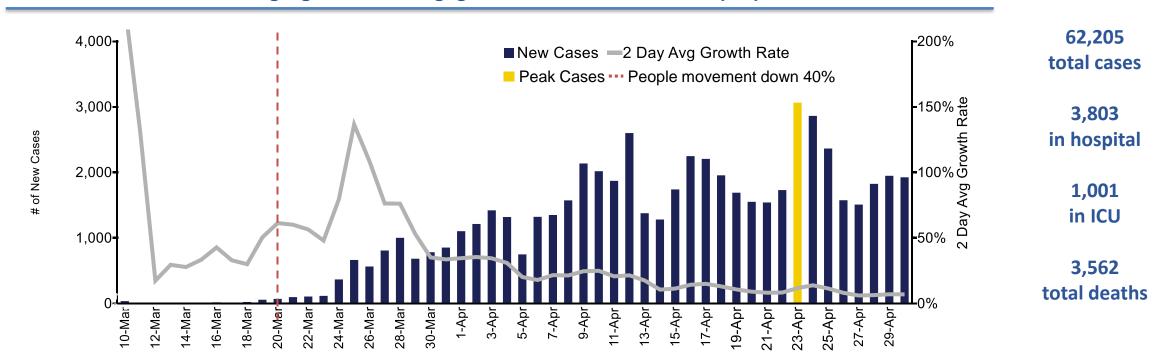

Spain Return to Work

- Waited until new cases ~20% of peak
- Handed out 10M masks and 1M+ testing kits
- Allowing non-essential construction, manufacturing to return to work
- New cases since rose to ~80% peak levels, requiring immediate scale back – opened too soon

Need to model out supply and demand and reopen with a buffer on total capacity utilization

Massachusetts COVID-19 Cases

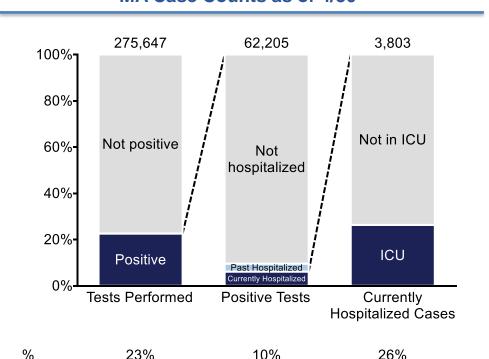

of new cases showing signs of flattening; growth rate has slowed since people movement slowed

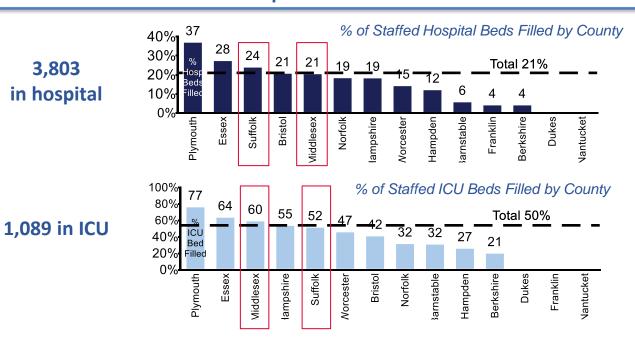

MA growth rate has dramatically slowed since stay-at-home mitigation efforts, and new cases / day may be in early stages of declining

MA Case Counts as of 4/30*

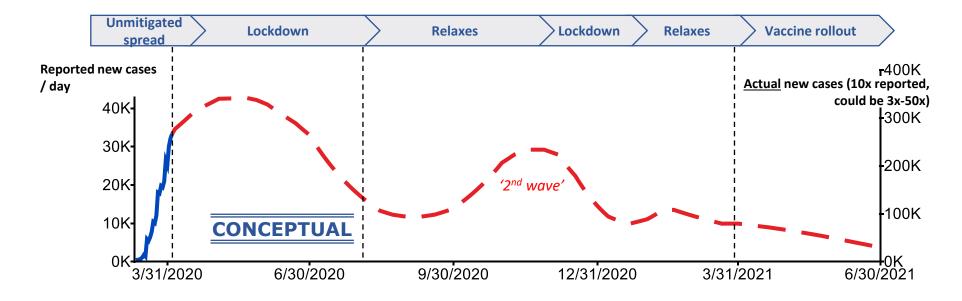

~21% of hospital beds and ~50% of ICU beds occupied with COVID-19 patients

Approximately ~10% of positive cases in MA hospitalized ~21% of hospital beds and ~50% of ICU beds are currently filled by COVID-19 patients

Critical to "Avoid the W"

What we need to prevent:

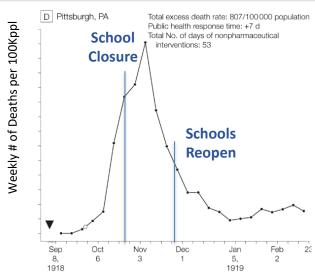

Sub-optimal public health approach creates the bad/bad box of ineffective lockdowns and high burden on healthcare systems – creating wider, deeper "U" or "W" that only ends with vaccine

Source: Bain Capital Partners analysis

1918 Spanish Flu Precedent

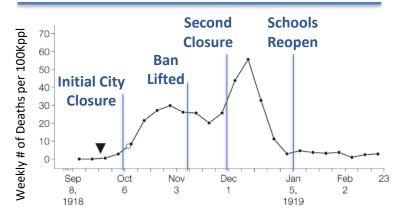

Philadelphia – too late to shut, overwhelmed

- Philadelphia acted too late to curb the death rate

 after waiting until after a massive parade to
 close the city, the virus overwhelmed hospitals
- But because initial rate so high, no second peak

St. Louis - reopened too early

 St. Louis acted early to curb the death rate – but opened too soon, causing a second spike much higher than the first

Denver - reopened with too little public guidance

- Denver acted early to curb the death rate but opened with too little public guidance, causing a second spike with similar magnitude as first
 - After initial closure was lifted, the public thronged the streets by the thousands, and new cases rapidly spiked to rates higher than previous

City closures & social distancing highly effective if instituted early – but second waves are likely and can be worse than the first if proper measures not taken before re-opening

When to Return to Work: Summary

- Building a dynamic hospital capacity / demand model based on current infection rate and system readiness for reopening critical to determining when to return to work
- MA new daily cases still trending **around peak**, although have shown signs of "flattening." Managing hospital capacity well so far, with **ICU beds only ~50% filled** with COVID-19 patients
- However, **critical to not reopen too soon** a demand imbalance could lead to a second peak more severe than the first, as evidenced by St. Louis' re-opening during the 1918 Spanish Flu

Need to focus on developing policies and protocols to keep hospital capacity balanced with demand and minimize the risk of another lockdown

Source: Bain Capital Partners Analysis

Contents

- Summary COVID-19 History & Economic Impact
- Timing: When to Return to Work
- The Key Three Steps: *How* to Return to Work

The Key 3 Steps to Achieve Hospital Balance & Worker Safety

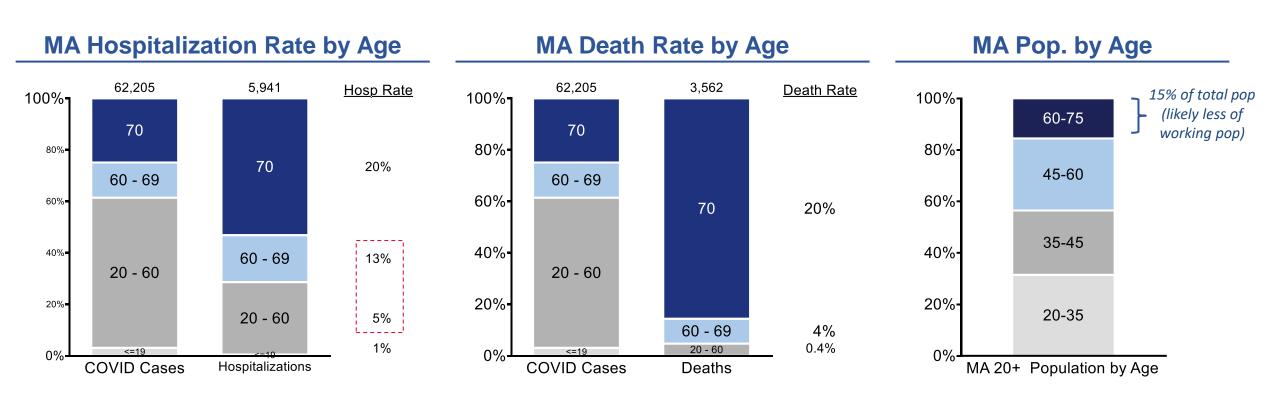

Segmentation: Sequence segments returning to work according to risk to lower hospitalization rate

Effective Therapeutics: While waiting for vaccine, implement effective treatments to curb hospitalization rate & fatality rate

Reduce R_T: Implement policies & procedures to reduce the rate of spread

Source: Bain Capital Partners analysis

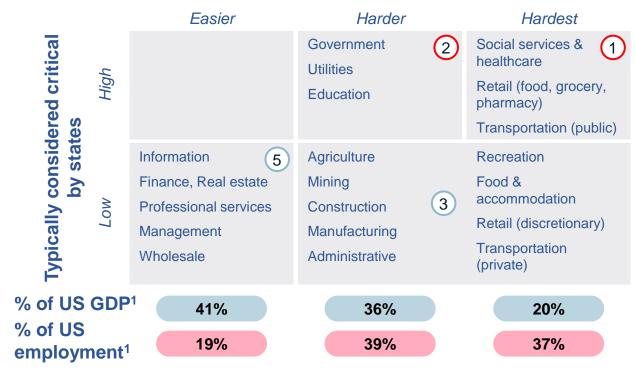

Age Segmentation

Excluding those aged 60+ from initial return to work segment may greatly reduce the hospital burden without affecting a large portion of the working population

Industry Segmentation

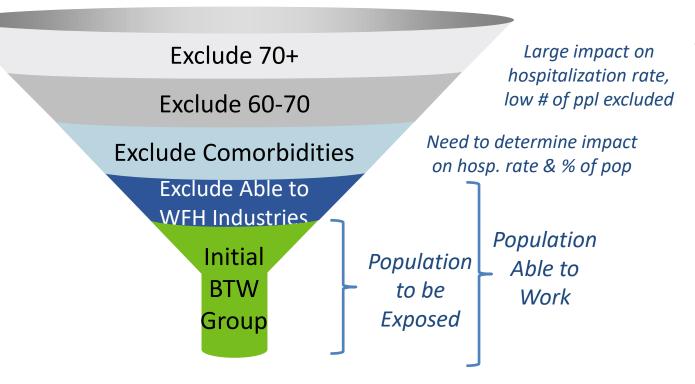

Need to Determine How To Group & Sequence Sector Reopening

- 1 Critical sectors that cannot work from home will be harder to safeguard, but may need to be part of first wave
- 2 Critical sectors with some ability to WFH may be able to encourage portions to continue remote work
- 3 Less critical sectors that cannot work from home Less critical, so possible to delay, but may need to be part of initial wave
- Less critical sectors able to work from home
 encourage these sectors to continue working from home where possible

Possible to phase industries returning to work by criticality and ability to continue working from home

Comprehensive "Funnel Framework"

Other Considerations

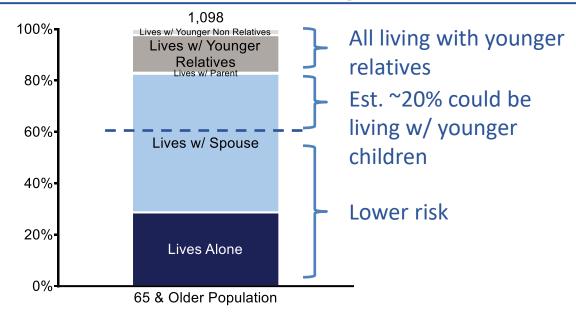

- Returning population's exposure to excluded population: how many excluded ppl will still be exposed by household members returning to work?
- Nursing Homes: how to deal with isolated high-risk populations interacting with workers?
- Workforce enablers: (childcare / education) – need enough capacity to support segment returning to work

A handful of key segmentation decisions can greatly reduce the hospitalization rate while still enabling large portions of the economy to restart

Source: Bain Capital Partners analysis

Other Considerations: Families with At-Risk Relatives

MA 65+ Population Living Situation

Strategies for At-Risk Individuals with Family Members Returning to Work

- Encourage workers living with at-risk individuals to strictly adhere to all policies and procedures
- In hot spots, could consider setting up alternative housing for at-risk individuals

Up to ~40% of 65+ population could be living with individuals returning to work. To manage these atrisk populations, may need to set up alternative living arrangements in hot spots

Other Considerations: Education

Reopening Schools Earliest to Open Latest to Open Reopened schools Reopening Considering Schools opening kindergartens and in low-risk areas reopening schools potentially next Action outside Tokyo primary schools to graduating school year students Many regions with Opening after a Oldest students Opening after bars, low case count, but month in lockdown. can keep masks cinemas, and Risks / limited risk for disinfecting schools on, but still risk of restaurants Mitigation children themselves twice a day asymptomatic transmission

Key Considerations

- Schools should consider risk to children themselves (likely low) and their transmission to others (higher)
- Criticality for economic activity a concern, school reopening often a prerequisite to parents returning to work
- Transpiration and child care also necessary preconditions to allowing people to return to work, will need mitigating safety measures

Reopening schools and child care precondition to returning to work, but carries key risks. Will also need plan for other key enablers (e.g., transportation)

The Key 3 Steps to Achieve Hospital Balance & Worker Safety

Segmentation: Sequence segments returning to work according to risk to lower hospitalization rate

Effective Therapeutics: While waiting for vaccine, implement effective treatments to curb hospitalization rate & fatality rate

Reduce R_T: Implement policies & procedures to reduce the rate of spread

Source: Bain Capital Partners analysis

Types of Solutions & Timeline

| | First Wave "Repurposed" Therapeutics | Second Wave New Therapeutics | Third Wave Vaccines |
|--------------------|--|--|--|
| Use Case | Acute remediation | Prevent and treat | Long-term prevention |
| Drug Candidates | RemdesivirNiclosamideFavipiravir | Human antibodies Monoclonal and polyclonal New compounds targeting essential viral proteins | Inactivated virus particles Live-hybrid viruses RNA-based vaccines Moderna, CureVac, BioNTech |
| Challenges | Dose likely higher than existing use cases, supply limited | • FDA approval timelines are usually 30 days for testing, 3-6 months for approval | Unknown if vaccines will need to be seasonal (like influenza) or durable long-term (like measles) |
| | April-June 2020 | July-September 2020 | April 2021-April 2022+ |

Therapeutics in development, but vaccine 18+ months away

First Wave – "Repurposed" Therapeutics

How to Accelerate Therapeutic Development

Rapid FDA Approval

Investigational New Drug Review

- Issue: Companies must wait 30 days after submission to implement trials
- Solution: FDA should ask relevant questions before receiving IND, allow trial initiation immediately

Government Funding

Purchase Guarantees

- Issue: Insufficient PPE including gloves, gowns, masks, and N95s
- Solution: Provide companies financial guarantees above market prices, regulatory relief

Scale Production

Scaling Existing Production

- Issue: Individual companies cannot produce enough of emerging therapies
- Solution: Facilitate manuf. of promising candidates by other U.S. drug cos

New Drug Application (NDA)

- Issue: FDA review of an NDA typically takes 3-6 months
- Solution: FDA communicate daily with relevant companies, complete NDA review within 1 week

Test and Trace Funding

- Issue: Hospitals, others lack supplies to conduct fastest tests
- Solution: Provide funding guarantees for viral testing and serological test to detect antibodies

Free Up U.S. Plant Capacity

- Issue: Need capacity to scale treatments prior to approval
- Solution: FDA should approve new plants for the production of other medicines

Commentary

Government action can turbo charge vaccine and therapeutic development & deployment

What we can do to help:

- Encourage frequent communication between FDA & companies & push for rapid FDA approval
- Provide financial stability to companies scaling production
- Help U.S. plants be ready and able to produce therapeutic candidates

New therapies and vaccines months to years off, but targeted government action can accelerate development

0K-

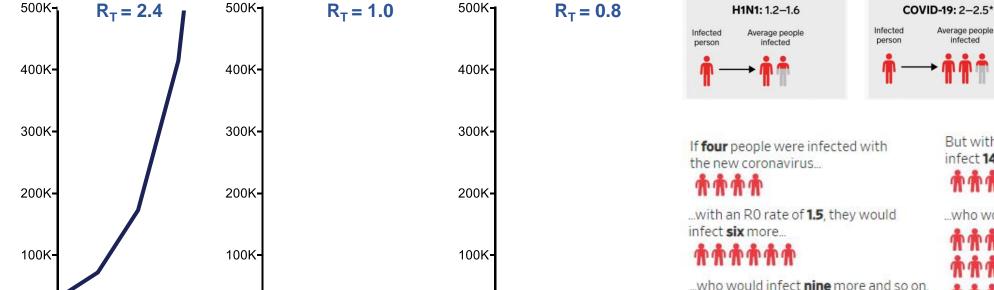

roday

Reducing R_T: Why It Matters

0K-

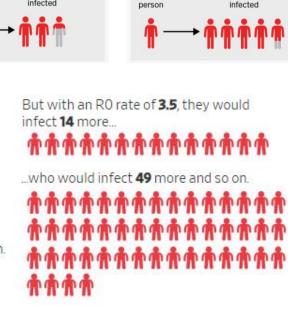

roday

MA New Cases Under Different R_T

0K-

Visualizing R_T

Infected

Lower spread can significantly reduce the number of daily new cases, despite greater population exposure

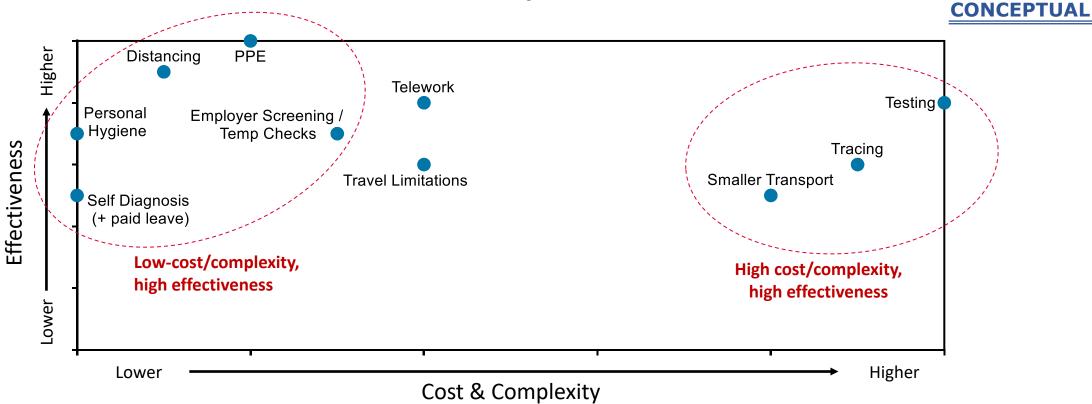

ተተተተተተ

Potential Policies to Reduce R_T

| | | PPE / Masks | Mandated mask & PPE use |
|------------|------------|----------------------------------|---|
| sive | | Personal Hygiene | Frequent hand washing or sanitizing. Avoid touching eyes, nose and mouth. Good respiratory hygiene |
| Expensive | | Self-Diagnosis | Comprehensive check-list of symptoms each worker considers before leaving home |
| | | Distancing / No Large Groups | Social distancing at work where possible. Staggered shifts and lunch times |
| Less | A 0 | Workspace Cleaning | Frequent workplace deep cleaning. Hygiene zones with mandatory sanitization checkpoints in between |
| | Group | Employer Screening | Temperature measurement and symptom screening upon entry |
| | Ū | Re-designing Workspace | Re-modeling of workspace to ensure greater spacing between employees. Improved air filtration and ventilation. Touch-free handles and interfaces |
| a > | | Telework | Encourage telework where possible |
| Expensive | | Travel limitations | Discourage travel unless absolutely necessary. Before traveling, ensure virus levels low at home & destination |
| ben | | Smaller Transport Methods | Limit use of mass transit when possible. Encourage carpooling or deploy corporate vans where hygiene easier |
| More Ex | Group B | Tracing | Team of $^{\sim}$ 5,000 tracers in MA conducting manual interviews with positive cases and alerting and quarantining those who were in contact with a positive case |
| Σ | ָטֿ L | Testing | 6-10 centralized testing centers in MA performing 100K tests a day |

Large variety of possible strategies to help reduce R_T – should begin with most effective & lowest cost, but will likely need higher cost effective measures as well (testing, tracing)

Framework for Possible Workplace Norm Policies

Large variety of possible strategies to help reduce R_T – should begin with most effective & lowest cost, but will likely need higher cost effective measures as well (testing, tracing)

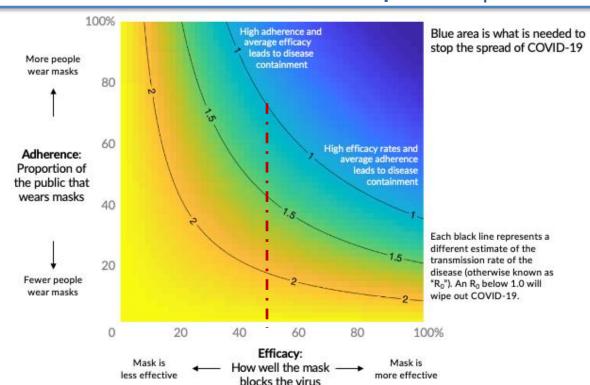

Source: Bain Capital Partners Analysis

Potential Policies to Reduce R_T

- Group A: Masks, Self-Diagnosis and Employer Screening
- Group B: Testing & Tracing

Theoretical Effectiveness of Masks & PPE

Theoretical Mask Use Impact on R_T

Key Considerations

- Adherence: Higher adherence, even with less effective masks, can greatly reduce R_T.
 Consider making PPE mandatory
- Supply & Efficacy: Is there adequate supply of the necessary level of efficacy? (i.e., easy to supply cloth masks but lower efficacy)

Mean % Filtration Efficiency of Various Masks

Note: Data based on Bacteriophage MS2 (23 nm in diameter) - COVID-19 virus particles are ~125 nm in diameter

| Scarf | 100% Cotton Masks | Tea Towel | Surgical Masks | N95 |
|-------|----------------------|--------------|-------------------|------|
| 49% | 51% | 72% | 89% | 95%+ |

Widespread use of masks, even lower quality cloth masks, can have a significant impact on R_T

Self-Diagnosis

Daily Symptom Checklist

| Symptom | % of Cases w/ Symptom |
|------------------------|-----------------------|
| Fever | 64% |
| Sinus Pain | 50% |
| Cough | 46% |
| Altered sense of smell | 44% |
| Expectoration | 32% |
| Stuffy nose | 25% |
| Chills | 18% |
| Fatigue | 18% |
| Sore throat | 13% |
| Headache | 13% |
| Difficulty breathing | 11% |
| Joint or muscle pain | 10% |
| Diarrhea | 6% |
| Vomiting | 3% |

Potential Policy & Considerations

- Mandate employees / students certify (via smartphone app / website for example) they are not experiencing any of the listed symptoms
- Incentivize adherence with paid sick leave policies
- Provided adherence is high, self-certification could detect a significant amount of symptomatic cases, including mildly symptomatic cases
- Recent studies suggest true number of asymptomatic cases quite rare (2-6%), suggesting meticulous and accurate daily symptom surveying and self-reporting can be highly effective in lowering R_T

Meticulous and accurate daily symptom surveying and self-reporting can be highly effective in lowering R_T

Source: Scientists to Stop COVID-19

Employer Screening

Example Employer Screening Case Studies

- Wuhan, China all arriving employees must submit to at least four temperature checks daily
- Amazon using thermal cameras at its operations facilities to screen workers for fevers
- Some grocery stores are using non-contact forehead infrared thermometers to temperature test associates as they arrive for work
- Colorado governor announced temperature checks at workplaces will be part of reopening plan

Potential Considerations

- Not effective at reducing R_T on its own: only 64% of cases present with fever, and carriers are contagious in the period of time before fever manifests. Will need to be combined with other norms & screening measures
- Implementation could be challenging: will require additional PPE and thermometers that could be difficult to acquire
- Medical information will have to be safely stored: all temperatures taken should be treated as confidential medical information and stored as such

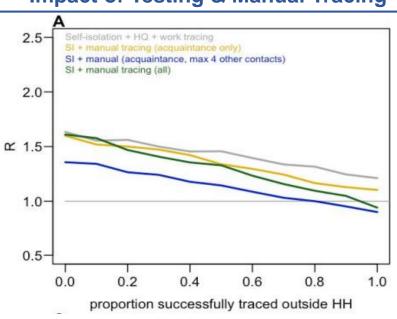

Temperature checks and other employer screening are useful tools when used in combination with other policies

Potential Policies to Reduce R_T

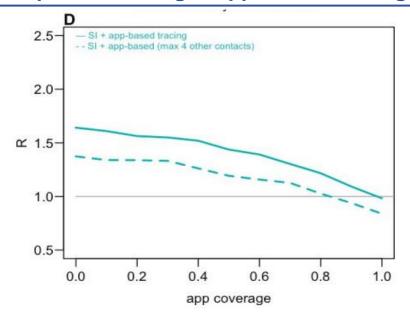

- Group A: Masks, Self-Diagnosis and Employer Screening
- Group B: Testing & Tracing

Combined Testing & Tracing Program Effectiveness

Impact of Testing & Manual Tracing

Impact of Testing & App-Based Tracing

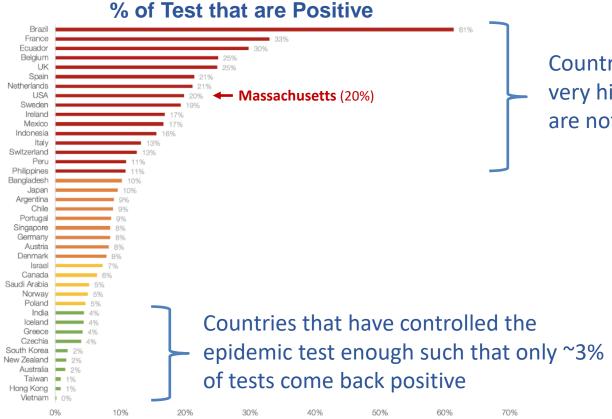

Study Conclusions

- Self-isolation of symptomatic cases alone: reduces R_T by 32%
- Household quarantine + selfisolation reduces R_T by 37%
- Self-isolation + app-based tracing reduced R_⊤ by 44%
- Self-isolation + manual tracing of all known contacts reduces R_T by 57%
- Self-isolation + manual tracing of all contacts reduces R_T by 67%

Testing and tracing strategies can *more than double* the impact on R_T of self-isolation alone Three important factors to a testing & tracing strategy: (1) how many infected are ID'd and isolated, (2) how many contacts are traced and quarantined, and (3) how quickly each is done

The Importance of Prolific Testing

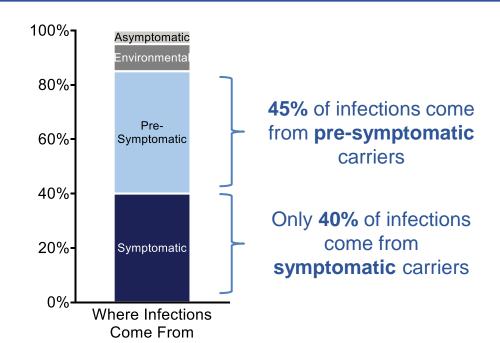

Countries that are overwhelmed have very high rates of positive tests – likely are not testing enough

The countries that have contained the pandemic only find ~1-3% positive cases during testing ~20% of MA cases come back positive – need to significantly increase level of testing

The Importance of Tracing

Estimated COVID-19 Transmission Sources

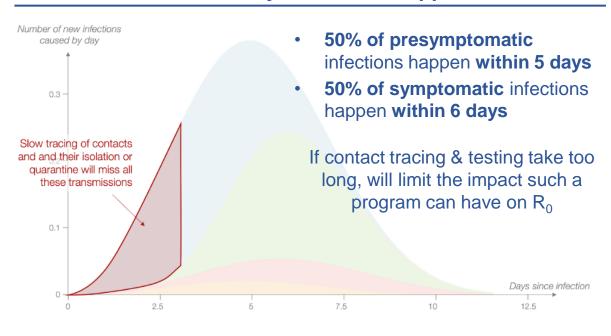

- If we **only test and isolate people with symptoms**, we can reduce R_T by **40% at most** –
 this will not be effective enough on its own
- If we also trace contacts and test them, possible to also catch the pre-symptomatics, reducing R_T by up to 85%

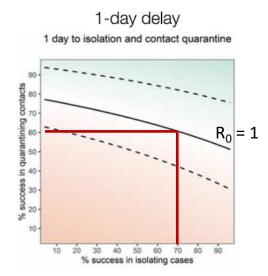

Recent research suggests $^{\sim}45\%$ of infections are caught from pre-symptomatic carriers If only test symptomatic individuals, can only reduce R_T by 40%. But a combined testing & tracing program that catches asymptomatic carriers can reduce R_T by up to 85%

The Importance of Speed

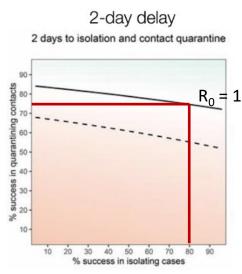

How Quickly Infections Happen

Testing & Tracing Speed v. Impact on R_T

If testing & tracing happens within 1 day, only need to successfully isolate 70% of cases & 60% of infected contacts to reduce R_T below 1

But if takes 2 days to test & trace, will need to successfully isolate 80% of cases & 75% of infected contacts to reduce R_T below 1

Speed is vital – the larger the delay between onset and successfully testing & tracing, the lower the impact on R_T . Need a program that can successfully test & trace 70-80% of contacts within 2 days

Testing: Who to Test

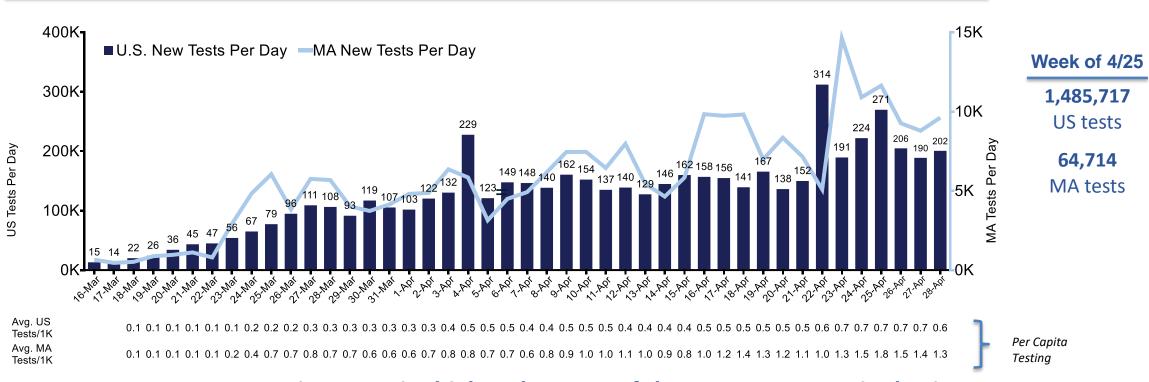

Possible Testing Plans

MA Today **Goal Expansive Minimal** Universal **Bare Bones Moderate** Those with strong Those with mild symptoms, other Those with strong Those with mild Everyone every **Population Tested** symptoms + causes ruled out symptoms symptoms week contacts traced in hot spots ~10K / day ~20K / day ~50K / day ~100K / day ~1M / day # Tests Required / Current testing ~1,500 positives @ ~1,500 positives @ ~1,500 positives @ ~7M residents ÷ day in MA 8% detection rate 3% detection rate 3% detection rate + capacity 7 days a week 30 contacts/positive Cost¹ ~\$6M / month ~\$12M / month ~\$30M / month ~\$60M / month ~\$600M / month 100% % Pop. Tested Example Countries

Need to prioritize who to test today and make testing as efficient as possible, while working to increase capacity to ~100K/day

Current Testing Capacity

New Tests Per Day

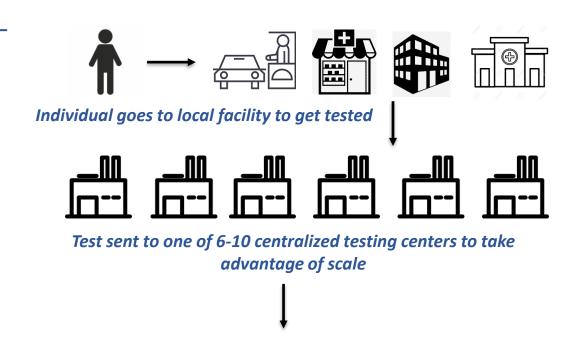

MA Testing capacity higher than rest of the US on a per capita basis, but both need to expand dramatically to reach goals of 30M national tests / week

Source: https://covidtracking.com/data/us-daily, Mass.gov

Building the Necessary Testing Capability

Proposed Rapid Centralized Solution

- MA contracts directly with a large/multiple large diagnostics company(s) who can handle 100K+ tests/day
- Provider sets up 6-10 centralized testing centers to take advantage of scale and ramps up ability to perform 100K tests/day
- In addition to centralized facilities, utilize current healthcare infrastructure and local facilities (hospitals, urgent care clinics, pharmacies, etc.)
- Diagnostics companies require 6-8 weeks to ramp production
 vital to set up contracts as soon as possible

Results delivered same-day or next-day

Given shortage of testing capacity, Massachusetts should <u>rapidly</u> explore avenues to secure capacity

Source: Discussions with Industry Experts, Bain Capital Partners Analysis

Testing: Timeline of Solutions

More expensive & difficult

Short-Term

- Centralized testing through a handful of large diagnostic companies
- 6-10 centralized testing centers
- Existing HC infrastructure used whenever possible
- Production ramped to ~100K/day

Medium-Term

- Frequent saliva-based testing administered once a week
- 10 centralized testing centers continue to process tests, each able to process ~100K/day
- Production ramped to ~1M tests/day

Less expensive & easy

Long-Term

- Universal at-home testing kits
- Saliva-based
- Cheap & easy to administer

Should work towards a more universal at-home testing program (infeasible today given technology and capacity constraints)

Source: Bain Capital Partners Analysis 47

Contact Tracing: Five Key Questions

1. Who Qualifies as a Contact?

Identifying who should be traced and their risk category

2. What Procedures Should Contacts Follow?

Isolation and self-assessment based on risk level

3. How Many Contacts Do We Need to Trace?

Extensive tracing of 70-90% of contacts needed to slow spread

4. How Many Investigators Do We Need?

Thousands of investigators needed to trace 70-90% of contacts

5. How Do We Use Technology to Help?

Digital tracing can increase efficacy considerably

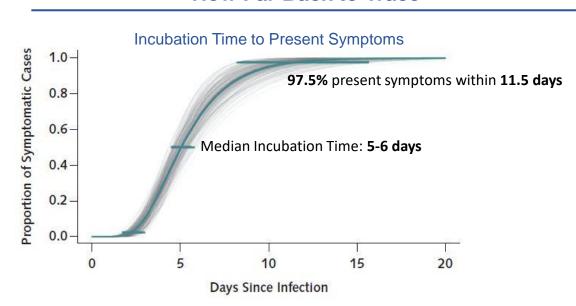

Contact tracing necessary to slow spread and will require large manual and digital effort

Source: Bain Capital Partners Analysis, Tomas Pueyo

Dedicated to Growth... Committed to Action

Who Qualifies as a Contact?

How Far Back to Trace

- Median incubation period is 5-6 days, full range up to 14 days Should trace & group contacts into high, medium, and low
- Need to track all contacts from previous two weeks

Example Case Study: Canadian Classification System

| High | Medium | Low | | |
|---|---|---|--|--|
| Close contact | Non-close contact | Transient interactions | | |
| Provided direct care | Provided direct care | Walking by the case | | |
| without PPE | with PPE | Briefly in same room | | |
| • Lived with infected person (e.g., family) | Prolonged contact but not within 6 feet | Exposure for less than15 minutes | | |
| Prolonged contactwithin 6 feet of person | of person | | | |
| Direct contact (e.g. sneezed on) | | | | |

risk buckets

Need to isolate and test family members, those in contact >15 minutes closer than 6 feet

What Procedures Should Contacts Follow?

Example Case Study: Canadian Guidelines

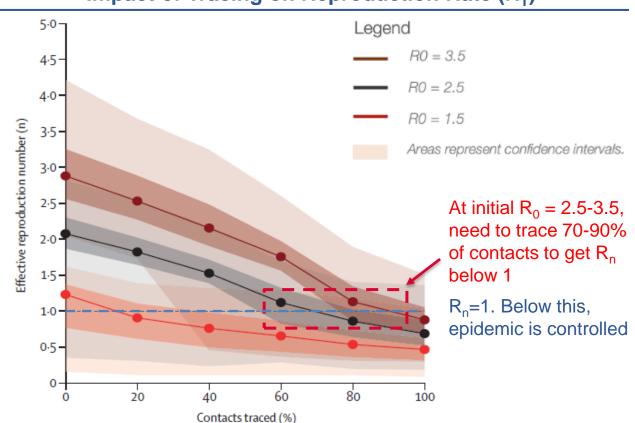

| | High Risk | Medium Risk | Low Risk |
|------------|---|--|---|
| Example | Family Member | Provided direct care while wearing PPE | Walked by on street |
| | Quarantine at home for 14 days after exposure | Self-monitor for symptoms such as fever or cough | Follow actions recommended for entire |
| Procedures | Practice good hand hygiene and respiratory etiquette | Avoid close contact with individuals at higher risk for severe illness | population |
| | Self-monitor for symptoms such as fever or coughRecord temperature daily | Follow actions recommended for entire population | |

Need to determine policies & procedures for contacts to follow based on risk level. Should only high risk contacts be self quarantined, or should medium risk contacts be quarantined as well?

Dedicated to Growth... Committed to Action

How Many Contacts Do We Need to Trace?

Impact of Tracing on Reproduction Rate (R_T)

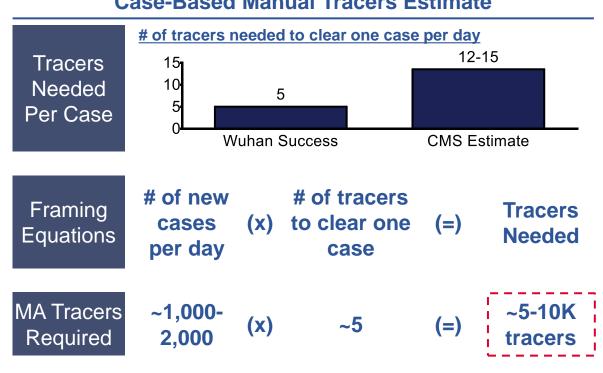

Key Considerations

- Tracing required varies depending on basic reproduction number (R₀) of COVID-19 without remediating efforts
- If R₀ is 2.5, need to trace 70% of contacts to control epidemic – studies estimate 20 people per case
- If R₀ is 3.5, need to trace 90% of contacts to control epidemic – studies estimate 30 people per case
- Additional measures taken to help lower R_T will reduce burden on exactness in contact tracing

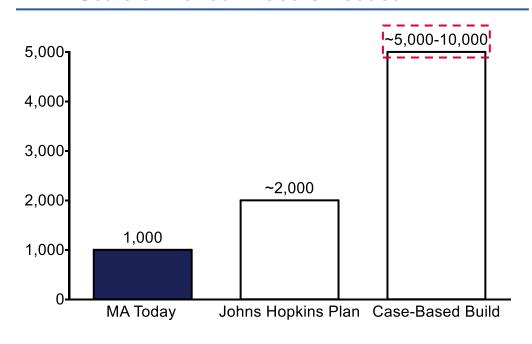

Will likely need to trace and isolate 20-30 closest contacts of each positive case as fast as possible

How Many Investigators Do We Need?

Case-Based Manual Tracers Estimate

Scale of Manual Tracers Needed in MA

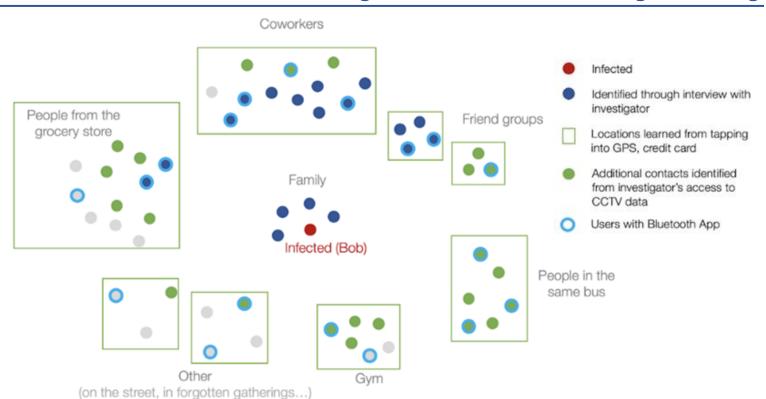

MA may need up to ~5-10K contact tracers

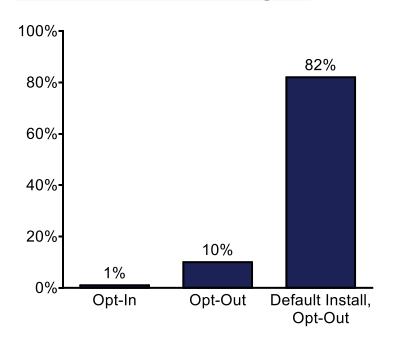

How Do We Use Technology to Help?

Illustrative Contacts Identified through Manual Interview and Digital Tracing

Opt-In vs. Opt-Out Bluetooth App

Share of contacts sent to investigators

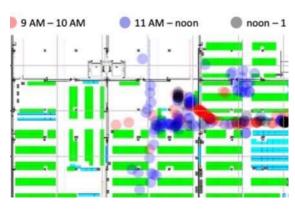

Will be difficult to identify 70-90% of contacts with manual tracing alone. Digital tracing can help manual tracers identify far more contacts, particularly with opt-out Bluetooth apps

Sources: Tomas Pueyo 53

Workplace Digital Tracing: Example Case Study

Exposure Heat Map – Locix App

Each dot represents a spot where two workers passed each other within 6ft

- Locix building a tool designed to track where people have been at work within a few centimeters
- Other proposed solutions (e.g., Microshare) may involve workers wearing badges, key rings or wristwatches embedded with inexpensive Bluetooth beacons to effectively trace populations without universal smartphone adoption

Example Solutions

Devices Used

Smartphone app

Badges, key rings, and wristbands

Smartphones, IoT sensors, asset trackers, appliances

Technology Used

Companies are building surveillance tools to monitor spread of coronavirus inside offices

Sources: Financial Times, company websites 54

Testing & Tracing: Summary

- Testing and tracing can have a **large impact on reducing R**_T (up to ~2x more effective than self-isolating alone)
- In order to be effective, testing & tracing programs need to capture ~70% of contacts within 1-2 days. MA leading the way in the US on tracing (have already assembled a team of ~1000 tracers), but will likely need ~5-10x more tracers to accomplish this
- To accurately capture all cases & test contacts, will need ~100K tests/day. MA capacity slowly ramping (achieving ~10-15K / day currently). Need to rapidly explore avenues to performing ~100K tests / day, as ramping will likely take ~6-8 weeks post-contract

Although testing / tracing can have a significant impact on reducing R_T , that impact will be constrained by the time it takes to build up capacity, and the cost associated with large-scale efforts

Source: Bain Capital Partners Analysis 55

Legal Feasibility of New Workplace Norms

Key Legal Questions & Considerations

- How to make sure on-site temperature testing, symptom screening, and storing information are compliant with HIPAA and the ADA?
- Can compliance with health & safety guidelines be conditions of employment? How to deal with employees that refuse to comply?
- How to ensure a non-discriminatory implementation of policies and protocols?
- How to implement changes and protocols with a unionized workforce?
- How to deal with potential negligence & lawsuit risk related to new outbreaks and/or deaths?

Ropes & Gray Emerging Principles

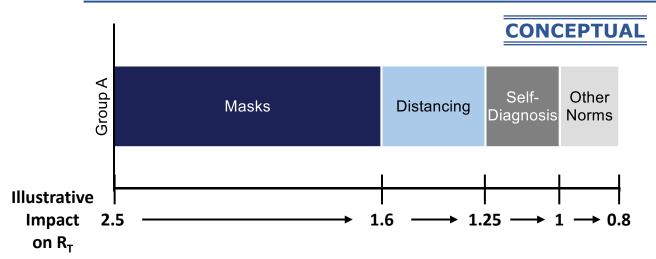

- Afford employees a safe working environment by adopting and enforcing scientifically-based work rules & providing appropriate supplies & support
- Align work rules & practices with guidelines from the cognizant federal, state, and local authorities
- Comply with federal, state, and local **laws and regulations**
- Respect the special requirements of disability rights laws, including as they apply to comorbidity
- Cooperate with state and local public health departments
- To the greatest extent possible, keep private the health and social information of individual employees

Several legal considerations to implementing new workplace norms. Key questions are (1) what the state should mandate, (2) consistent implementation, and (3) how to provide legal guidance for SMBs

Source: Ropes & Gray. Does not constitute legal advice

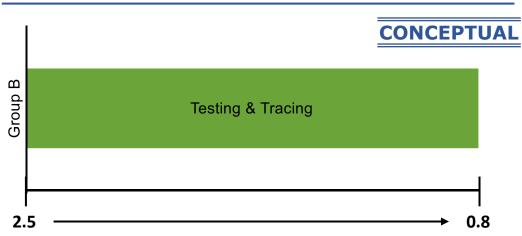

Reducing R_T Summary Thought Model

Impact of Workplace Norms

• Workplace norms such as universal mask wearing, distancing and self-diagnosis can significantly reduce R_{T}

Impact of Testing & Tracing

 A robust testing & tracing program (~100K tests/day, 5-10K tracers + digital tracing) can have a similar impact on reducing R_T as workplace norms

Source: Bain Capital Partners analysis 57

The War on COVID-19

Timing & Hospital Capacity Constraint Model

Build a dynamic hospital capacity / demand model based on current infection rate and system readiness

Segmentation

Implement segmentation model, sequencing segments returning to work according to risk and ability to safeguard

Co-living

Develop guidelines for high risk segments living with segments returning to work

Enablers

Develop guidelines for back-to-school (including childcare) and transportation

Treatment

Identify and rapidly deploy effective therapeutic treatments and longer-term a vaccine

Therapeutics

While waiting for vaccine, implement effective treatments to curb hosp. rate

Vaccine

Accelerate vaccine development & prepare for deployment at-scale

Reduce R_T

Implement policies & procedures to reduce the rate of spread

Workplace Norms

Develop workplace norms to minimize reoccurrence

Testing & Tracing

Develop massive testing & tracing plan to be used to identify & contain virus spread

United we will win the war against COVID-19

White House Return to Work Framework

Gating Criteria

Symptoms

 Downward trajectory of flu and COVID-19 like illnesses reported within a 14-day period

Cases

 Downward trajectory of positive test rates or documented cases. within a 14-day period

Hospitals

- All patients treated without crisis care
- Testing program for healthcare workers in place

- Vulnerable individuals shelter in place
- Others should maximize distance in public, avoid groups of >10 people, wear PPE in public
- Encourage telework • Close common areas
- Minimize non-essential travel
- Certain venues (bars, schools) should remain closed

- Vulnerable individuals shelter in place
- Others should maximize distance in public, wear PPE

Phase Two

- Can resume non-essential travel
- Encourage telework
- Close common areas
- Provide accommodations for vulnerable populations
- Restricted venues (bars, schools) can reopen with limited capacity

- Vulnerable individuals can resume public interactions

Phase Three

- Others should minimize time spent in crowded environments, wear PPE in public
- Visits to senior care facilities and hospitals can resume
- Large venues can operate under limited distancing protocols
- Bars may operate with increased occupancy

61 Source: whitehouse.gov

Intermittent Work Phasing Option

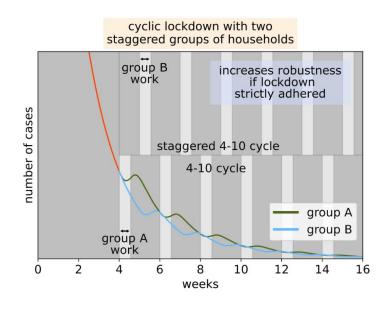

To reduce risk of second wave, could begin by phasing groups in cycles of 4 work days and 10 lockdown days

Those infected at work reach peak infectiousness during lockdown days

| day 1 | day 2 | day 3 | day 4 | day 5 | day 6 | day 7 | | // | day 13 | day 14 | day 15 |
|----------|--------|--------|---------------------|------------|------------|------------|---|----|-------------------|-------------------|--------|
| work | work | work | work | lockdown | lockdown | lockdown | , | // | lockdown | lockdown | work |
| infected | latent | latent | becoming infectious | infectious | infectious | infectious | | | not infectious | not infectious | |

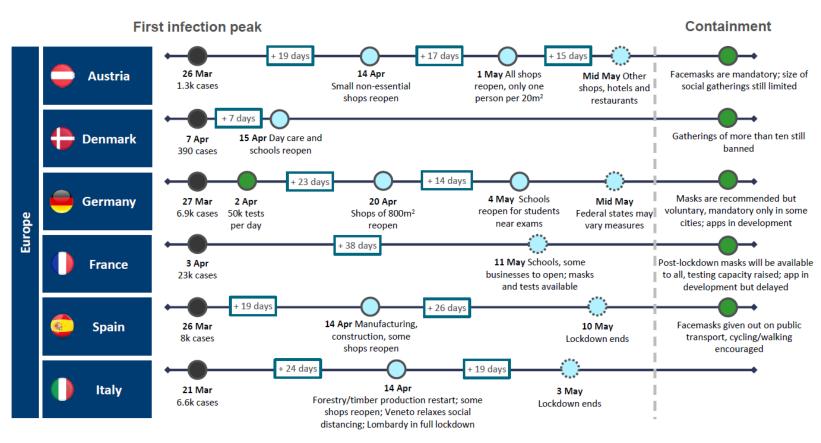

infection on first day

Potential Impact

Could explore alterative back-to-work phasing to help reduce healthcare burden while allowing groups to return part-time earlier, potentially before system fully ready

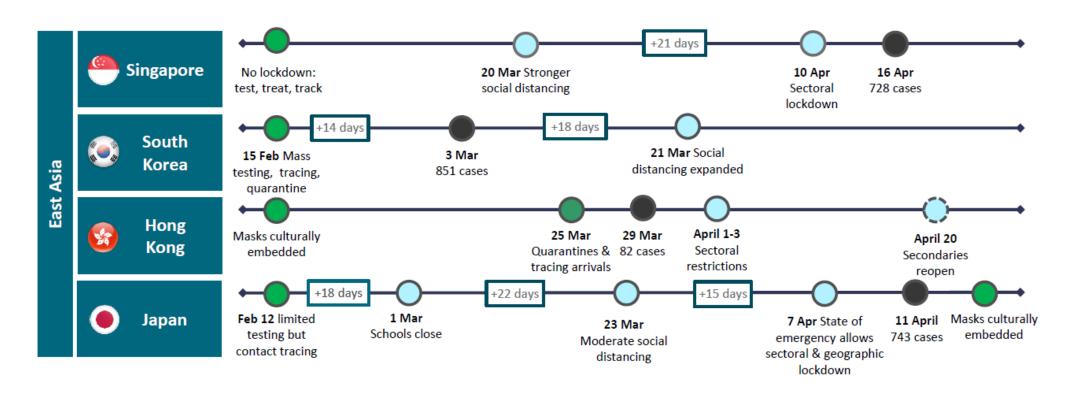

European Timelines

European countries are starting to ease, but containment strategies appear limited, risking acceleration of the virus. This may mean a return to lockdown

BACKUP

East Asia Timelines

East Asia countries are strongly emphasizing containment (masks, testing and tracing), which has enabled most countries to avoid full lockdowns and keep infection spikes below western peers

Dedicated to Growth... Committed to Action

Testing: How to Test

Case Study: Drive-Thru Testing

- South Korea has set up drive-through testing centers. Tests take 10 minutes and results texted to you the next day. Able to test ~10ppl/hour
- At this point, all 50 U.S. states have also adopted drive-through testing centers. However, currently can take up to a week to get results

Other Potential Testing Locations

Should utilize current healthcare infrastructure to make testing widely available and easy to access

Goal is to make testing easy and quick, in order to test & track as many individuals as possible within the first 2 days of exposure

Source: NPR.org, Bain Capital Partners Analysis

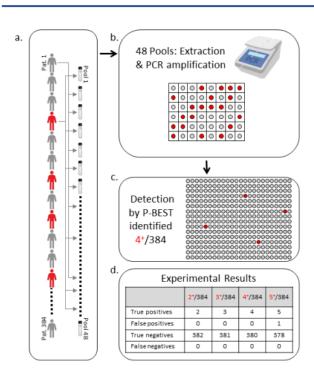

BACKUP

Making Testing More Efficient: Test Pooling Case Study

Stanford's Test Pooling

- In early testing, Stanford **pooled samples** into groups of 9-10 and tested the group
- Of the 292 groups pooled, only two came back positive – further analysis showed that one person in each group was positive
- Concluded pooling can make mass testing far more efficient, but only works when prevalence is low

Recent COVID-19 Sample Pooling Study

- A recent study showed pooling samples in groups up to 48 samples/group preserved accuracy (all positives identified, with no false negatives)
- Group recommends pooling methods for asymptomatic carriers (e.g., in expected low prevalence groups) – can make such testing far more efficient

Research still emerging, but may be possible to pool samples in groups of 10-50, significantly increasing testing efficiency (able to run 100K pooled tests in the same time as 10K individual tests)

Dedicated to Growth... Committed to Action

What Tests to Use: Viral Testing Overview

Key Considerations

How it works: Viral genetic information extracted using swab and amplified in a machine using PCR

What it detects: If you currently have COVID-19

Average cost: TBD

Pros

- Detects current infection
- High throughput
- Inexpensive
- Can collect at home

Cons

- Slow results
- Requires many swabs, limited reagents
- High throughput machines require trained technicians

Testing Companies & Capacity

Key Companies

- Abbott Molecular
- BD
- BioGX
- Cepheid
- DiaSorin Molecular
- Hologic
- LabCorp
- NeuMoDx
- PerkinElmer
- Quest Diagnostics

Full List in Appendix

- Quidel Corporation
- Roche Molecular **Systems**
- Thermo Fisher Scientific

Sample High Throughput Machines / Products

| Company | Abbott | BD / BioGX | Cepheid | Hologic | NeuMoDx | Roche | Thermo Fisher | Labs incl. Quest, LabCorp, etc. |
|----------------------|--------|---------------|-----------------------|---------|------------------|-------|------------------|------------------------------------|
| Machine / Product | m2000 | BDMax | GeneXpert Infinity | | 288 Molecular | | TaqPath | Lab Developed Tests |
| Daily Capacity | 470 | 360 | >2,000 | 1,150 | 864 | 4,128 | >1,500 | >200 |

Ideal for combination testing and tracing program because of ability to detect infection in real time

67 Sources: Company websites, FDA, Centers for Medicare & Medicaid Services

BACKUP

What Tests to Use: Antibody Testing Overview

Key Considerations

How it works: Samples blood, test device detects antibodies created by body to fight virus

What it detects: If you previously had COVID-19

Average cost: TBD

Pros

- Can identify previous infections
- Takes seconds to test
- Doesn't require swabs
- Can detect previous asymptomatic cases

Cons

- Antibodies slow to develop
- Unclear how protected those with antibodies are
- Program based on antibody testing could encourage ppl to catch virus
- False positives

Testing Companies & Accuracy

Companies

- Abbott
- BioMedomics Inc
- Bioperfectus Technologies
- Cellex
- Decombio

Biotechnology

- DeepBlue Medical
- Innovita
- Premier Biotech
- Sure Biotech
- UCP biosciences

Full List in Appendix

- VivaChek Biotech
- Wondfo Biotech
- SD Biosensor
- Biolidics Limited
- Biomedomics
- Epitope Diagnostics

| Sample | Test | Specificity | |
|--------|------|-------------|--|
|--------|------|-------------|--|

| | | • | <u> </u> | | | |
|-------------|-------------|--------------|----------|----------|----------|----------|
| Company | BioMedomics | Bioperfectus | Decom | Bio | DeepBlue | Innovita |
| Specificity | 87% | 95% | 90% | , 0 | 84% | 96% |
| Company | Premier | Sure | UCP | VivaChek | Wondfo | Epitope |
| Specificity | 97% | 100% | 98% | 95% | 99% | 90% |

Note: FDA allowed self-validation for first kits without data validation. The above data is self-declared and may not be accurate

Ideal for identifying percentage of population that has been infected, but less ideal for testing/tracing

What Tests to Use: Saliva v. Nasal Testing

Nasal or Throat Swabs

- Currently most broadly administered test
- Recommended by the CDC
- Invasive (involves a long Q-tip-like swab stuck up the nose or into the back of the throat)
- Can take 1-5 hours to run the test
- Requires a trained professional to administer
- Can have a false-negative rate of ~30%+

Saliva Tests

- Recently received FDA emergency use authorization
- Minimally invasive (simply spit into vial)
- Can be reliably self-administered
- Requires less PPE and personnel to administer
- Not enough information to determine accuracy, but recent studies estimate
 ~90% to ~95% as effective as nasal or throat swabs

Other Emerging Options

- DNA test that can deliver results in 40 minutes using CRISPR
- Take-home test FDA recently authorized the first take-home kit; receive kit with doctor approval and mail back

Should keep track of emerging testing technologies and focus on options that make the testing process as easy and quick as possible while retaining accuracy

BACKUP

Range of Digital Tracing Options

| | | Decentralized | | | Centralized |
|-------------------|--------------------|--|---|--|--|
| | | | | | |
| | | Google and Facebook | Europe | South Korea | China |
| Description | Policy | Alerts users if they've been in contact with a positive case | App that uses central servers to alert contacts of positive cases | Government publishes detailed reports about confirmed cases | Traced residents who left Wuhan, involuntary quarantine |

Digital tracing can be highly effective, but privacy concerns a key issue

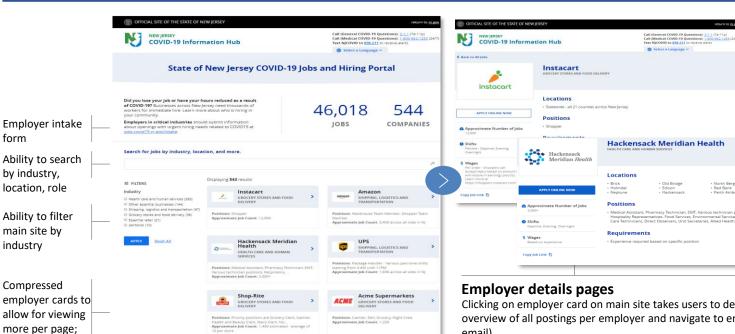

employers still

total # of posts

listed in order of

Reimagining Support Services: Workforce Redeployment BACKUP

New Jersey State Platform Example

CVS Health

Clicking on employer card on main site takes users to details page; able to see overview of all postings per employer and navigate to employer's website (or send email)

Future releases may allow users to explore an employer's postings by role/location (in contrast to current site, where all of Hackensack's hospital postings are listed together, without specific wage data, # postings per role, locations per role, etc.)

How it works

Job posting platform, featuring postings by employers whose labor needs are spiking due to COVID-19, hosted by NJ **Economic Development Authority**

No matching service, purely 'bulletin board' style.

Outcomes so far

Job posts: 540+ employers posted 46,000+ jobs on the site as of 2 April

Visitors and clicks: Site had ~340K unique visits in its first 10 days, with ~20K aggregate clicks on "Apply Now" buttons

New Jersey has set up a 'bulletin-board' style platform to help match unemployed with new labor needs

Sources: New Jersey Covid-19 Jobs Portal
